

Autism spectrum disorder (ASD) is a neurodevelopmental disorder characterized by difficulties with social interaction and communication, and certain characteristic patterns of behavior that cause impairment in learning and functions in daily life. ASD occurs more commonly in children with Down syndrome (at least 10% compared to 1.8-1.9% of children without Down syndrome). A formal diagnostic evaluation is recommended to diagnose ASD in children with Down syndrome, so that children can receive appropriate educational, behavioral and possibly, pharmacologic treatments for impairing symptoms.
